

CSE 382
Exercise - XAML Number Pad

- Add a new tab to the XAML project that displays the following number pad shown on the left. Initially, do not worry about colors, centering, font size, etc.
 - Make sure that the buttons behave in the expected way:
 - Number is initially set to 0
 - There should never be a leading zero in the window for multi-digit numbers (e.g., 098)
- Now use Resources to ensure that the buttons have a uniform appearance. It should be easy to modify the resources to get the GUI to look like the one on the right.
- Commit and push your source code to Git.
- Submit a video demonstrating your completed project.
 - In your video start with your app looking approximately like the one shown on the left.
 - Run the program, demonstrating the pressing of the buttons.
 - Stop the program (or use hot reload) and then make a few changes (show yourself actually making the changes on camera) to colors and sizes so that the app appears like the one on the right. Restart your app to show the display looks approximately like the one on the right. You do not need to demonstrate the number pad aspects again.
